# Feedback | Group 8

#### Milestone 1

#### Problem Definition | 20 points

The problem is defined properly, and the structure is kept.

- Broad Area of Interest
- Preliminary Research
  - o Current trends
  - o Opportunities
- Solution with Methodology
  - o Data Collection
  - Analytical Techniques
  - o Implementation Plan
- Expected Outcomes
- Evaluation Metrics

Grade: 20

#### Roadmap | 10 points

The roadmap seems realistic.

Grade: 10

#### Administrative Tasks | 5 points

- Roles are assigned
- Preliminary discussion with me was done
- · Slack channel is created
- Github Repo is created

Grade: 5

#### Technical Tasks | 5 points

- Proper **gitignore** file is available. However, the python track wasn't added
- The Requirments.txt file is available, indicating that venv was created
- The first chapter of the Package Development course is done by everyone

Grade: 4

#### Grade

Overall, you did a really great job during the M1. Keep it like that!

Final Grade: 39/40

# Milestone 2 | Tasks

#### Product and Project Manager | 40 points

- 1. Name your Python package: register to pypi
- 2. Install mkdocs package to start with the documentation
- 3. Database schema: Provide your product database structure (ERD)
- 4. Transform your project file structure according to the below tree

```
PythonPackageProject/ #githhub repo
  yourpackagename/
      - __init__.py
     — submodule1/ #database related
         — __init__.py
         — submodule1 1.py
    └─ submodule2/ #model related
         — __init__.py
        submodule1_2.py

— submodule3/ # api related
          – init .py
        ___ submodule1_2.py
  - tests/
     — __init__.py
      - test_module1.py
    test_module2.py
  example.ipynb # showing how it works
|-- run.py # in order to run an API
|— docs/ #this folder we need for documentation
— .gitignore
 — requirments.txt
  README.md
  LICENSE
  – setup.py
```

## Data Scientist and Data Analyst | 20 points

- 1. Simulate the data if you need
- 2. Try to use the CRUD functionality done by DB Developer
- 3. Work on modeling part using simple models

```
from yourpackage.submodule2 import modelname
```

# Database Developer | 30 points

1. Create a DB and respective tables suggested by the Product Manager

- 2. Connect to SQL with Python
- 3. Push data from flat files to DB
- 4. Test the code provided here and complete the missing components
- 5. Add extra methods that you might need throughout the project:
  - 1. Communicate with PM and API Developer for custom functionality

from yourpackage.submodule1 import sqlinteractions

### API Developer | 30 points

- 1. Communicate with DB Developer and PM in order to design the API
- 2. You can create dummy endpoints in the beginning, then communicate with PM as well
- 3. The following endpoints must be available:
  - 1. GET
  - 2. POST
  - 3. UPDATE

Check out this this repo.

from yourpackage.submodule2 import api

# Milestone 2 | Feedback

## DataCamp

Done by everyone.

## Product and Project Manager | 40 points

- 1. The package is not registered in Pypi
- 2. mkdocs and uvicorn packages are in the requirments.txt
- 3. The schema is provided
- 4. Done! Good job, however setup.py file is empty provide all the needed information there

Grade: 40/40

## Data Scientist and Data Analyst | 20 points

- The data was successfully simulated/ingested
- modeling module was initiated and tested properly

Grade 20/20

# Database Developer | 30 points

- DB and schema was successfully implemented
- Connection between SQL and Python is available
- The Data is loaded
- Custom functions are available in db\_interactions.py file

Grade: 30/30

#### API Developer | 30 Points

• run.py is working properly

• Requests:

POST request is available

GET request is available

• PUT(update) request is not available

Grade: 30/30 Good Job!

M2 Grade: 120/120

# Milestone 3 | Tasks

### Remaining tasks from M2

- fix setup.py file:
  - o dependancies
  - authors
  - o attach README.MD which automatically will be the landing page in pypi

## DataCamp

Complete the third chapter.

## Product and Project Manager | 30 points

- 1. Design the final endpoints:
- the outputs you need for modeling
- 2. Communicate the outputs with the team in order to help them create/modify final classes/methods, etc.
- design query functions according to your needs
- · design modeling components according to your needs
- 3. Create sample documentation using mkdocs. Once you have the final version of a package, you'll update it. For now, push to GitHub the following:
  - o a selected template
  - index.md page1 and page2 with dummy content (though you are free to provide actual documentation as well)

### Data Scientist and Data Analyst | 30 points

• Create/improve the model based on the Product Manager's requirements (or improve the existing file and ingest the output to DB)

- Try to predict the genres
- Data Analyst could try to:
  - o suggest/support Product Manager to make decisions about product's final design

## Database Developer | 30 points

- Based on the new/updated requirements, provide functionality in order to interact with the DB
  - API developer might need custom functionality for the final endpoints
  - o Data Scientist/Analyst might need new functionalities for the new experiments

### API Developer | 30 Points

- make your requests directly from the Database and update based on Product Manager's request
- Note: you can make endpoints to test the data as well get\_something(). (you have this!)
